Stablecoin swaps.

One execution interface.

USDC / EURC routing for wallets and payments apps.

Chakra

Compare supported venues. Build the transaction.

The user authorizes in their wallet.

Open source · Arc Testnet proof · Proposed Circle integration

Every venue adds integration work.

A USDC/EURC swap spans liquidity selection, execution and wallet authorization.

01 / LIQUIDITY

Different pool math

Apps must compare supported venues and handle missing or thin routes.

02 / EXECUTION

Different interfaces

A quote must become executable calldata with approvals and a deadline.

03 / WALLET

Authorization + gas

Embedded wallets need a reliable payload and bounded sponsorship eligibility.

Quote → build → authorize → settle

One API and web app, with venue-aware routing and wallet-ready transaction data.

QUOTE

Compare supported pools

BUILD

Unsigned calldata

AUTHORIZE

User wallet approval

SETTLE

Atomic on-chain route

Factory-gated venues / Permit2 pull / Fail closed when no route exists

1 USDC → 1.629188 EURC

Recorded Arc Testnet wallet execution · 5 September 2026 · Presto single route

60563600

BLOCK / TESTNET CHAIN 5042002

MetaMask authorization

Successful splitSwap entry point

Single route; no mined split claimed

Open transaction receipt ↗

Open recorded demo ↗

Execution evidence before scale.

Public stats API fetched 30 September 2026. Testnet activity does not establish customer acquisition.

5	5 USDC	2
INDEXED SWAPS	NOTIONAL	UNIQUE ADDRESSES

0 split swaps. Index freshness lag: about 44 hours.

No verified customer count, organic volume or revenue claimed.

A working router. A new Circle path.

The request funds incremental integration, verification and documentation.

EXISTING BASELINE

Arc Testnet

Router, Solidity execution, quote/build API, SDK source and external-wallet receipt.

CIRCLE REQUEST

Wallet + gas path

New SCA adapter, mined smart-account swap, separate sponsored swap and CCTP handoff.

SELF-FUNDED

Mainnet proof

Mainnet deployment and external-wallet proof are prerequisites, excluded from this ask.

Four jobs. Twenty sequential weeks.

24,000 USDC requested · one engineer · evidence required at every milestone

01	**Circle SDK adapter** npm release, examples, authorization mapping	4 weeks	**4,800**
02	**Circle SCA swap** Mined Testnet swap + mainnet readiness	7 weeks	**8,400**
03	**Gas Station sponsorship** Separate mined swap + matching sponsorship record	4 weeks	**4,800**
04	**CCTP V2 inbound** Burn/receive receipts + post-receive Chakra result	5 weeks	**6,000**

Acceptance lives in the receipts.

Configuration and simulations support the proof; mined execution has its own gate.

WALLETS

One mined SCA swap

Testnet receipt linked to quote/build and Circle authorization; mainnet configuration with a live route.

GAS STATION

A different receipt

Separate Testnet transaction matched to a redacted sponsorship record; bounded policy and failure checks.

CCTP V2

One linked transfer

Source burn and Arc receive; then Chakra quote and swap, or a dated no-route result.

Start with one wallet integrator.

A proposed first-adopter target, followed by a public and reproducible integration record.

ADOPTION

First live swap

Publish a named integrator and its receipt if achieved. Track time to first swap and dated npm downloads.

OPERATIONS

Observable API

Report rate limits, 429s and stated-interval uptime. Publish dated swap count, volume and pair mix.

REVENUE PLAN

2 bps on mainnet

Proposed 0.02% fee on successful swaps. 1M USDC routed would yield 200 USDC before costs; current Testnet fee is zero.

Built by an engineer who ships.

Kyler Nguyen · technical founder · contract, routing, API and integration work

Solidity + Rust + TypeScript

Public contributions across Chakra, Kamui, MGK Protocol and Oreka:

DEX routing, VRF, perpetuals and prediction-market infrastructure.

One engineer. Sequential scope.

24,000 USDC

Bring the existing Chakra route into a verifiable Circle wallet and sponsorship flow.

800 engineer hours × 30 USDC/hour

20 weeks · four milestones · no separate expense or markup

Existing router and self-funded mainnet proof excluded
